API changelog

🕒 3 min read · Updated 13 October 2026 · Verified against [c761e51](#) on 2026-09-27

What changed in the API, release by release, from a client's point of view: new routes and headers, changed statuses, and the releases that changed nothing a client can see.

<https://docs.gurbanisoul.com/api/changelog/>

Only what a client of the API can observe: routes, statuses, headers and response shapes. The project's full history, including the website, the app and the data, is in [CHANGELOG.md](#)¹. Since the golden contract arrived, every release has kept the legacy `/api` bodies byte-identical unless an entry below says otherwise. The contract's own version, `info.version` in the [OpenAPI description](#), is `1.0.0`.

Release	Date	What a client sees
1.4.0	—	The OpenAPI operations gain short summaries (documentation only). Production still answers every path from <code>all</code> .
A later release, after the app is live	—	Production's five contexts each answer from their own function, so <code>X-Service</code> names the context (<code>search</code> , <code>reader</code> , ...) instead of <code>all</code> . Bodies unchanged.
1.3.10	2026-09-25	Production's API runs as Vercel functions inside the website's project, on the same origin. Every body is byte-identical to 1.3.9, proven by replaying the golden contract before the switch; <code>X-Service</code> is <code>all</code> .
1.3.9	2026-09-25	<code>/api/v1/*</code> : every route with the same body and strict errors (<code>404</code> for an unknown endpoint; <code>{"error": {"code", "message", "request_id"}}</code>). <code>X-Request-Id</code> on every response, reusing a valid incoming id. <code>X-Service</code> on every response.
1.3.8	2026-09-24	None. The code moved into three repositories; the database bytes and every response are unchanged.
1.3.7	2026-09-24	The OpenAPI 3.1 description (<code>contract/openapi.json</code>) of all 26 routes, with schemas inferred from real responses. <code>/healthz</code> (liveness) and <code>/readyz</code> (readiness, per service).
1.3.1	2026-09-20	<code>/api/verify</code> rejects a claim over 600 characters (<code>400</code>). Readings get <code>Cache-Control</code> and an <code>ETag</code> , and answer <code>If-None-Match</code> with <code>304</code> . HSTS on every response. A 15-second socket timeout and a bounded worker pool. The access log stops recording query strings.
1.1.1	2026-09-15	<code>/api/meta</code> and <code>/api/health</code> report commit , the running build's source commit.
1.1.0	2026-09-15	<code>/api/shabad/{comp_id}</code> returns the composition's printed heading with its body (a heading run shares the composition's <code>comp_id</code>), and <code>404</code> for an unknown or vacated <code>comp_id</code> instead of an empty result.

Before 1.0.0 (2026-09-06), the project used separate web version numbers; the routes a client uses today, from `ang` and `search` to the analytics, timing and forms routes, were added then. Their history is in the older sections of `CHANGELOG.md`.

What counts as a change here

- **Added:** a route, a parameter, a response field or a header. Clients should ignore fields they do not know.
- **Changed:** a status, an error, a limit or the meaning of a field. The golden contract makes each of these a reviewed decision; a breaking change would get a new contract major version and a new path prefix (versioning and caching).
- **Not a change:** the wording of `note` fields or `search`'s `mode`, the order of JSON keys, and anything under the hood (hosting, services, caching layers) that leaves bodies and statuses as they were.
