

iOS app

Release status

🕒 3 min read · Updated 13 October 2026 · Verified against 0f89c40 on 2026-09-27

Where the app stands with Apple: every upload from the app's ledger, rendered at build from the pinned commit, and the sign-off record of the first App Store submission.

<https://docs.gurbanisoul.com/ios/release-status/>

Two records in `gurbani-soul-ios` say where the app stands, and this page reads both at the commit the wiki pins. The **ledger** (`ios/testflight-builds.json`) records every upload, written by the archive script at upload time. The **build log** in the TestFlight test plan records the owner's sign-offs and the submission. Neither records what Apple decides afterwards: an approval, a rejection or the day a version goes live is known in App Store Connect, not here.

The first App Store submission

1.3.10 (1) is the first build submitted for App Review: submitted on 2026-09-26 at 03:49 UTC, with **manual release**, built from platform `b5c6a0d` and the public (Gurmukhi-only) database profile. Every owner gate of the **App Store submission runbook** is signed in the sign-off record: the brand and trade-dress gates, the scripture-fidelity charter (8 of 8 on a physical iPhone), the hardware pass (10 of 10) and the App Store Connect listing (no drift; “Data Not Collected”; free, 4+).

Manual release means an approved version waits at *Pending Developer Release* until the owner releases it; approval alone does not put it on the store.

Apple approved 1.3.10 (1) on 2026-10-13. When this page was last edited it was waiting at *Pending Developer Release*.

The first update

1.4.0 (1) was uploaded on 2026-10-13 from the app's tag `v1.4.0`, built against platform `2c41123` with the public profile and the same bundled database as 1.3.10. It is the first build archived and uploaded by the hosted workflow instead of a maintainer's Mac. It adds “Forget location”, “Clear reading history” and the Spotlight clean-up (privacy and on-device data). App Store Connect accepts a new version only after the previous one is released, so it is submitted after 1.3.10 goes live; its sign-off record in the TestFlight test plan is open until then.

Every upload

Read at build time from [ios/testflight-builds.json](#)¹ at a386422. All 29 uploads.

1.1.3 (2)	—	TestFlight	public	backfilled from App Store Connect (uploaded before the ledger existed)
1.1.3 (1)	—	TestFlight	public	backfilled from App Store Connect (uploaded before the ledger existed)

How to read it:

- **Channel.** A *TestFlight* build is for testers. An *App Store* build is archived from the release tag with CHANNEL=appstore, the only kind the submission preflight accepts. Such a build is a *candidate*: most platform releases since 1.3.2 have one (the ledger has no upload for 1.3.1 or 1.3.6), and 1.3.10 (1) is the first to be submitted (one version number).
- **Profile.** Every upload so far is *public*: the English translation layer is not licensed for distribution, so no build carrying it has been uploaded (the licence gate).
- **Built from.** The app, platform and dataset commits the build was made from, and the sha256 of the database inside the archive, which proves it holds exactly that dataset's iOS database. The platform and dataset commits are recorded from 1.3.8, when the code split into three repositories. The earliest rows were backfilled from App Store Connect after the fact, so they have no date or commits, and their note says so.

How this page stays current

The ledger is read when the wiki is built, from the commit in docs-site/sources.lock.json. Every Monday the docs-pins workflow moves that pin to the app repository's main when a pinned file has changed (the ledger is one), through a reviewed pull request, so a new upload appears here within a week of it, once that pull request merges. The paragraph about the first submission is written by hand; the next submission's record belongs in the build log first, then here.
