Reference

Docs health

2 min read · Updated 22 November 2026

How current the wiki is, measured at every build: fresh and stale verified stamps, median stamp age, coupling debt per pull request, and how often code changes touch docs/.

https://docs.gurbanisoul.com/reference/docs-health/

These numbers are measured when the site is built, by `python3 tools/docs_check.py --health`. The deploy-docs `docs` job writes them to `docs-site/.health.json` just before the build. That file is never committed, so a local build without it shows no numbers.

Pages	147
Pages with a `verified` stamp	80
Stamps that are fresh	67.5% (54 of 80)
Stale stamps, by reason	3 stamp not in history; 1 cited code changed since the stamp; 22 cites no code, stamp older than 60 days
Median stamp age	59 days
Coupling debt, last 30 days	33 of 74 merges into `integration` changed covered code without its page or a Docs-impact line (94 page flags)
Code commits that also changed docs/, last 30 days	60.9% (78 of 128)
Code areas on a wiki page	63 of 67 (4 exempt, 0 in the backlog with no page yet)
Sibling pins behind their branch	sggs-data: 0 commits behind; gurbani-soul-ios: 3 commits behind

Measured 2026-11-25 at `7783889d41c0`

What each number means

- **Fresh stamps.** A page with a `verified: {commit, date}` stamp is fresh unless one of three things is true. The code it covers changed since the stamp (its `covers:`, or the files it cites; a `file#symbol` entry only when a change falls inside that definition). It cites no code and the stamp is more than 60 days old. Or the stamp's commit is not in the history. The full list is `python3 tools/docs_check.py --freshness`, and the weekly docs-freshness pull request carries it.
- **Median stamp age.** The median number of days since each `verified.date`.

- **Coupling debt.** The pull requests merged into `integration` over the last 30 days whose diff changed code a page covers while that page and its stamp stayed the same and the pull request's final description did not excuse it. Each first-parent merge `Merge pull request #N` is attributed to its pull request, and the description is read from GitHub, so a page named on its own `Docs-impact: docs/<page>.md – …` line (or a cited-files page under a `Docs-impact: none – …` line) is not debt. The rule applied is today's, from **the docs-impact check**, also to pull requests merged before it changed. It is measured on `integration` even when the site is built from `main`, where every merge is a release bundling many pull requests (the page said "15 of 15 merges" before 2026-11-22). A build without a token cannot read the descriptions: then every flag counts, and the table says the number is an upper bound.
- **Code commits that also changed docs/.** Of the non-merge commits in the last 30 days that changed code, the share that also changed a file under `docs/`. Tests, lockfiles, built output, `CHANGELOG.md` and the generators of generated pages do not count as code here.
- **Sibling pins behind their branch.** Shown only when the build has a token. It counts the commits between each sibling repository's pinned commit (`docs-site/sources.lock.json`) and the head of its branch.
